### Online Resource 1. Other basic definitons and properties

**Sdefinition 1.** The  $\delta$  near neighbor point set  $N_\delta(\mathbf{x})$  of point  $\mathbf{x}$  is defined as:

$$N_\delta(\mathbf{x}) = \{\mathbf{y} \mid 0 < \text{dist}(\mathbf{x}, \mathbf{y}) \leq \delta, \mathbf{y} \neq \mathbf{x}, \mathbf{y} \in D\}, \quad (\text{s1})$$

where  $\text{dist}(\mathbf{x}, \mathbf{y})$  is the dissimilarity measure between point  $\mathbf{x}$  and point  $\mathbf{y}$  in the data set  $D = \{\mathbf{x}_1, \dots, \mathbf{x}_n\}$ . Parameter  $\delta$  is a predefined threshold.

**Sdefinition 2** (Böhm et al., 2010). Point  $\mathbf{x} = (x_1, \dots, x_d)$  is a vector in  $d$ -dimensional Euclidean space. If each point  $\mathbf{x}$  is regarded as a phase oscillator based on Kuramoto model, with an interaction in the  $\delta$  near neighbor point set  $N_\delta(\mathbf{x})$ , then the dynamics of the  $k$ -th dimension  $x_k$  ( $k = 1, 2, \dots, d$ ) of point  $\mathbf{x}$  over time is described by:

$$x_k(t+1) = x_k(t) + \frac{1}{|N_\delta(\mathbf{x}(t))|} \sum_{\mathbf{y} \in N_\delta(\mathbf{x}(t))} \sin(y_k(t) - x_k(t)), \quad (\text{s2})$$

where  $\mathbf{x}(t=0) = (x_1(0), \dots, x_d(0))$  represents the original phase of point  $\mathbf{x}$ ,  $x_k(t+1)$  describes the renewal phase value in the  $k$ -th dimension of point  $\mathbf{x}$  at the  $t$ -step evolution, and  $\mathbf{y} = (y_1, \dots, y_d)$  is a  $\delta$  near neighbor point of point  $\mathbf{x}$  at the  $t$ -step evolution.

**Sdefinition 3** (Chen, 2017). The  $t$ -step  $\delta$  near neighbor undirected graph  $G_\delta(t)$  of the data set  $D = \{\mathbf{x}_1, \dots, \mathbf{x}_n\}$  is defined as:

$$G_\delta(t) = (V(t), E(t)), \quad (\text{s3})$$

where  $V(t=0) = \{\mathbf{x}_1, \dots, \mathbf{x}_n\}$  is the original vertex set,  $E(t=0) = \{(\mathbf{x}_i, \mathbf{x}_j) \mid \mathbf{x}_j \in N_\delta(\mathbf{x}_i), \mathbf{x}_i (i = 1, \dots, n) \in D\}$  is the original edge set.  $V(t) = \{\mathbf{x}_1(t), \dots, \mathbf{x}_n(t)\}$  is the  $t$ -step vertex set of the data set  $D$ ,  $E(t) = \{(\mathbf{x}_i(t), \mathbf{x}_j(t)) \mid \mathbf{x}_j(t) \in N_\delta(\mathbf{x}_i(t)), \mathbf{x}_i(t) (i = 1, \dots, n) \in V(t)\}$  is the  $t$ -step edge set, and the weight computing equation of edge  $(\mathbf{x}_i, \mathbf{x}_j)$  is  $\text{weight}(\mathbf{x}_i, \mathbf{x}_j) = \text{dist}(\mathbf{x}_i, \mathbf{x}_j)$ .

**Sdefinition 4** (Chen, 2017). The  $t$ -step average length of edges,  $\text{AveLen}(t)$ , in a  $t$ -step  $\delta$  near neighbor undirected graph  $G_\delta(t)$  is defined as:

---

\*Corresponding author. E-mail: chenxqscut@126.com.

$$\text{AveLen}(t) = \frac{1}{|E(t)|} \sum_{e \in E(t)} |e|, \quad (\text{s4})$$

where  $E(t)$  is the  $t$ -step edge set of  $G_\delta(t)$ , and  $|e|$  is the length (or weight) of edge  $e$ . The average length of edges in  $G_\delta(t)$  decreases to its limit 0, that is  $\text{AveLen}(t) \rightarrow 0$ , as more  $\delta$  near neighbor points synchronize together with time evolution. In our algorithm,  $\text{AveLen}(t)$  can be used to characterize the degree of local synchronization.

**Sdefinition 5** (Böhm et al., 2010). The cluster order parameter  $r_c$  characterizing the degree of local synchronization is defined as:

$$r_c = \frac{1}{n} \sum_{i=1}^n \sum_{y \in N_\delta(x_i)} e^{-\text{dist}(x_i, y)} \quad (\text{s5})$$

**Sdefinition 6** (Chen, 2017). A linear version of Vicsek model for clustering is defined as:

Point  $\mathbf{x} = (x_1, \dots, x_d)$  is a vector in  $d$ -dimensional Euclidean space. If each point  $\mathbf{x}$  is regarded as an agent according to a linear version of Vicsek model, with an interaction in the  $\delta$  near neighbor point set  $N_\delta(\mathbf{x})$ , then the dynamics of point  $\mathbf{x}$  over time according to Jadbabaie et al. (2003) and Wang et al. (2009) is described by:

$$\mathbf{x}(t+1) = \frac{1}{1+|N_\delta(\mathbf{x}(t))|} (\mathbf{x}(t) + \sum_{y \in N_\delta(\mathbf{x}(t))} \mathbf{y}), \quad (\text{s6})$$

where  $\mathbf{x}(t=0) = (x_1(0), \dots, x_d(0))$  represents the original location of point  $\mathbf{x}$ , and  $\mathbf{x}(t+1)$  describes the renewal location of point  $\mathbf{x}$  at the  $t$ -step evolution.

### The definitions of three information-theoretic measures:

**Sdefinition 7. Mutual Information (MI)**: the mutual information of two discrete random variables  $X$  and  $Y$  is defined as:

$$MI(X, Y) = \sum_{x \in X} \sum_{y \in Y} \left( p(x, y) \log \frac{p(x, y)}{p(x)p(y)} \right), \quad (\text{s7})$$

where  $p(x, y)$  is the joint probability distribution function of two random variables  $X$  and  $Y$ , and  $p(x)$  is the marginal probability distribution function of random variable  $X$ . So as  $p(y)$ .

**Sdefinition 8. Normalized Mutual Information (NMI, (Strehl et al., 2002))**: the normalized mutual information of two clustering results  $X$  and  $Y$  is defined as:

$$NMI(X, Y) = \frac{MI(X, Y)}{\sqrt{H(X)H(Y)}}, \quad (\text{s8})$$

where  $MI(X, Y)$  is the mutual information of two clustering results  $X$  and  $Y$ ,  $H(X)$  and  $H(Y)$  are the entropies associated with the clustering results  $X$  and  $Y$  respectively.

**Sdefinition 9. Adjusted Mutual Information (AMI, (Vinh et al., 2010))**: the adjusted mutual information of two clustering results  $X$  and  $Y$  is defined as:

$$AMI(X, Y) = \frac{MI(X, Y) - E\{MI(X, Y)\}}{\max\{H(X), H(Y)\} - E\{MI(X, Y)\}}, \quad (\text{s9})$$

where  $MI(X, Y)$  is the mutual information of two clustering results  $X$  and  $Y$ ,  $H(X)$  and

$H(X)$  and  $H(Y)$  are the entropies associated with two clustering results  $X$  and  $Y$  respectively, and  $E\{MI(X, Y)\}$  is the expected mutual information of two clustering results  $X$  and  $Y$ .

## Online Resource 2. The descriptions of SynC algorithm and ESynC algorithm

### OR2.1 The description of SynC algorithm

The original synchronization clustering algorithm named as SynC is developed by Böhm et al. (Böhm et al., 2010). In order to make a difference between SynC algorithm and our algorithm, we introduce it below using our language according to the description of (Böhm et al., 2010).

#### 1. The description of SynC algorithm

Stable 1. The main procedure of SynC algorithm.

---

**Algorithm Name:** The original Synchronization Clustering algorithm (SynC; Böhm et al., 2010).

---

**Input:** Dataset  $D = \{\mathbf{x}_1, \dots, \mathbf{x}_n\}$ , dissimilarity measure  $\text{dist}(\cdot, \cdot)$  and range parameter  $\delta$ ;

**Output:** The final convergent result  $D(T) = \{\mathbf{x}_1(T), \dots, \mathbf{x}_n(T)\}$  of the original dataset  $D$ ;

**Procedure:** function SynC ( $D, \delta$ )

/\* Initialization: \*/

1: IterativeStep  $t$  is set as zero firstly, that is:  $t \leftarrow 0$ ;

2: **for**  $i = 1, 2, \dots, n$  **do**

3:      $\mathbf{x}_i(t) \leftarrow \mathbf{x}_i$ ;

4: **end for**

/\* Execute the iterative synchronization process of the dynamical clustering: \*/

5: **while** ((the dynamical clustering does not satisfy its convergent condition) **and** ( $t < 20$ )) **do**

6:     **for**  $i = 1, 2, \dots, n$  **do**

7:         Construct the  $\delta$  near neighbor point set  $N_\delta(\mathbf{x}_i(t))$  for each point  $\mathbf{x}_i(t)$  ( $i = 1, 2, \dots, n$ ) by using Eq.(s1) of Sdefinition 1 of Online Resource 1 of Supplementary Material;

8:         Compute the renewal value,  $\mathbf{x}_i(t+1)$ , of  $\mathbf{x}_i(t)$  by using Eq.(s2) of Sdefinition 2 of Online Resource 1 of Supplementary Material;

9:     **end for**

10:     Compute the cluster order parameter of all points,  $r_c$ , using Eq.(s5) of Sdefinition 5 of Online Resource 1 of Supplementary Material;

11:     IterativeStep  $t$  is increased by 1, that is:  $t++$ ;

12:     **if** ( $r_c$  converges or ( $t == 20$ )) **then**

13:         We think the dynamical clustering reaches its convergent result, and then exit from the while repetition;

14:     **end if**

15: **end while**

16: Finally, we get a convergent result  $D(T) = \{\mathbf{x}_1(T), \dots, \mathbf{x}_n(T)\}$ , where  $T$  is the times of the while repetition from step 5 to step 15. The final convergent set  $D(T)$  reflects the natural clusters or isolates of the dataset  $D$ .

---

## OR2.2 The description of ESynC algorithm

Effective Synchronization Clustering algorithm (ESynC) is developed by Chen (Chen, 2017). In order to make a difference between ESynC algorithm and our algorithm, we introduce it simply below.

Stable 2. The main procedure of ESynC algorithm.

---

**Algorithm Name:** An Effective Synchronization Clustering algorithm (ESynC; Chen, 2017).

---

**Input:** Dataset  $D = \{\mathbf{x}_1, \dots, \mathbf{x}_n\}$ , dissimilarity measure  $\text{dist}(\cdot, \cdot)$  and range parameter  $\delta$ ;  
**Output:** The final convergent result  $D(T) = \{\mathbf{x}_1(T), \dots, \mathbf{x}_n(T)\}$  of the original dataset  $D$ ;  
**Procedure:** function ESynC ( $D, \delta$ )  
/\* Initialization: \*/

- 1: IterativeStep  $t$  is set as zero firstly, that is:  $t \leftarrow 0$ ;
- 2: **for**  $i = 1, 2, \dots, n$  **do**
- 3:      $\mathbf{x}_i(t) \leftarrow \mathbf{x}_i$ ;
- 4: **end for**
- /\* Execute the iterative synchronization process of the dynamical clustering: \*/
- 5: **while** ((the dynamical clustering does not satisfy its convergent condition) **and** ( $t < 20$ )) **do**
- 6:     **for**  $i = 1, 2, \dots, n$  **do**
- 7:         Construct the  $\delta$  near neighbor point set  $N_\delta(\mathbf{x}_i(t))$  for each point  $\mathbf{x}_i(t)$  ( $i = 1, 2, \dots, n$ ) by using Eq.(s1) of Sdefinition 1 of Online Resource 1 of Supplementary Material;
- 8:         Compute the renewal value,  $\mathbf{x}_i(t+1)$ , of  $\mathbf{x}_i(t)$  by using Eq.(s6) of Sdefinition 2 of Online Resource 1 of Supplementary Material;
- 9:     **end for**
- 10:     Compute the  $t$ -step average length of edges of all points,  $\text{Ave\_len}(t)$ , by using Eq.(s4) of Sdefinition 4 of Online Resource 1 of Supplementary Material;
- 11:     IterativeStep  $t$  is increased by 1, that is:  $t++$ ;
- 12:     **if** ( $\text{Ave\_len}(t) \rightarrow 0$ ) **then**
- 13:         The dynamical clustering reaches its convergent result, and then exit from the while repetition;
- 14:     **end if**
- 15: **end while**
- 16: Finally, we get a convergent result  $D(T) = \{\mathbf{x}_1(T), \dots, \mathbf{x}_n(T)\}$ , where  $T$  is the times of the while repetition from step 5 to step 15. The final convergent set  $D(T)$  reflects the natural clusters or isolates of the dataset  $D$ .

---

### Online Resource 3. The description of experimental data sets

Stable 3. The description of experimental data sets

(a) The description of some kinds of artificial data sets

| Data Sets<br>(DS) | Predefined Number<br>of Clusters (NC) | With Noise | Cluster<br>Semidiameter (CS) | Dimension<br>(d) |
|-------------------|---------------------------------------|------------|------------------------------|------------------|
| DataType1         | 7                                     | 1 isolate  | -                            | 2                |

(c) The description of three bmp picture data sets (obtained from Internet)

| <b>Picture Data Sets</b> | <b>Number of Pixels (<math>n</math>)</b> | <b>Dimension (<math>d</math>)</b> |
|--------------------------|--|-----------------------------------|
| Picture1                 | 100*100                                  | 3                                 |
| Picture2                 | 100*100                                  | 3                                 |
| Picture3                 | 200*200                                  | 3                                 |

### R3.1 DataType1 used in Fig. 1 is created by Python language

```
center = [[-200, 100],[-100, -100],[-200, -100], [0, 0], [100, 100],[100, 200], [200, 200]]
cluststd = [25, 20, 25, 15, 22, 25, 20]
x, y = make_blobs(n_samples=1000, n_features=2, centers = center, cluster_std = cluststd, shuffle =
False, random_state = 1)
```

### OR3.2 Other artificial data sets (DataType2, DS1 - DS16) used in simulated experiments are created by two C functions

```
#define DIMENSION 2
#define NUM_POINT 300
#define NUM_CLUSTER 5
#define MIN_DISTANCE 18
#define WIDTH 600
#define CLUSTER_DISTANCE 40

int Create_DataSet(struct Point DS[], int DataClass[], int NumPoint, int NumCluster)
{
    int i, j, k;
    struct Point *Core; /* Array Core stores the top left corners of clusters. */
    Core = (struct Point *) malloc(sizeof(struct Point) * NumCluster);
    if(Core == NULL)
    {
        printf("There is no enough space for Core[\n");
        return -1;
    }

## Online Resource 4. Other figures and tables of experimental results

### 4.2 Experimental results of some artificial data sets

#### 4.2.1 Compare the dynamic clustering processes of SynC algorithm, ESynC algorithm and SSynC algorithm

(a)  $t = 0$  (The original locations of 800 data points created from DataType2)

(b-1) SynC algorithm,  $t = 1$

(b-2) ESynC algorithm,  $t = 1$

(b-3) SSynC algorithm,  $t = 1$

(c-1) SynC algorithm,  $t = 2$

(c-2) ESynC algorithm,  $t = 2$

(c-3) SSynC algorithm,  $t = 2$

(d-1) SynC algorithm,  $t = 5$

(d-2) ESynC algorithm,  $t = 5$

(d-2) SSynC algorithm,  $t = 5$

(e-1) Sync algorithm,  $t = 45$

(e-2) ESynC algorithm,  $t = 45$

(e-3) SSynC algorithm,  $t = 45$

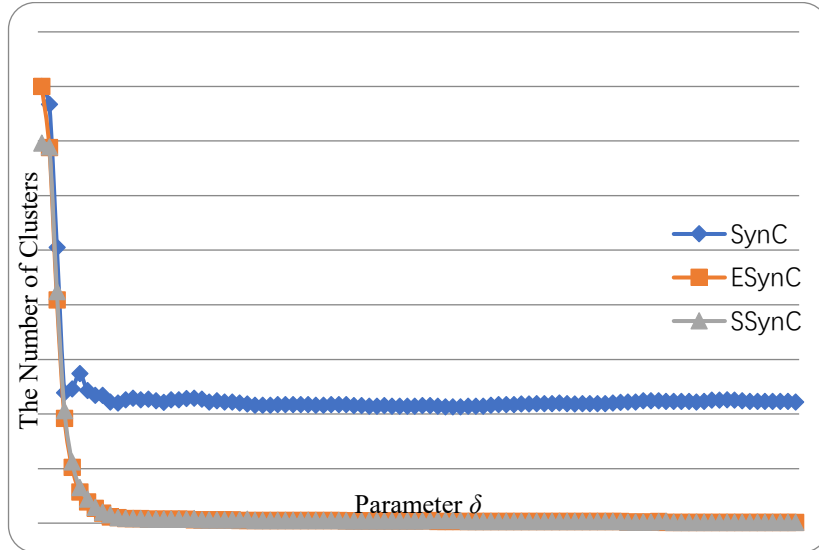

Sfig. 1. Compare the dynamical synchronization clustering processes with time evolution among Sync algorithm, ESynC algorithm and SSynC algorithm. From (a) to (e) of Sfig. 1, the data set has 800 points created from DataType2, parameter  $\delta$  is set as 18 in the three algorithms, and parameter  $\varepsilon$  is set as 1 in SSynC algorithm.

(a) The cluster order parameter  $r_c$  with  $t$ -step evolution ( $t$ : 0 - 49)

(b) The  $t$ -step average length of edges AveLen( $t$ ) ( $t$ : 0 - 49)

(c) The relation between the final number of clusters and parameter  $\delta$  ( $\delta$ : 0 - 99).

Sfig. 2. Compare SynC algorithm, ESynC algorithm and SSynC algorithm. In Sfig. 2, the data set has 800 points created from DataType2, and parameter  $\varepsilon$  is set as 1 in SSynC algorithm. In Sfig.2 (a) and (b), parameter  $\delta$  is set as 18 in the three algorithms.

### 4.2.3 Setting parameters in SSynC algorithm

(a) Parameter  $\varepsilon = 0.00001$

(b) Parameter  $\varepsilon = 1$

Sfig. 3. The number of active cores with time evolution of four datasets in SSynC algorithm. In Sfig. 3, parameter  $\delta$  is set as 22, parameter  $\varepsilon$  is set as 0.00001 and 1, and the numbers of points in the four data sets are all set as 2000.

(a) DS1

(b) DS2

(c) DS3

(d) DS4

Sfig. 4. The number of active cores with time evolution for several different values of parameter  $\epsilon$  in SSynC algorithm. In Sfig. 4, parameter  $\delta = 18$  in DS1 and DS3,  $\delta = 20$  in DS2,  $\delta = 22$  in DS4; parameter  $\epsilon$  is set as seven different value (0.00001, 0.0001, 0.001, 0.01, 0.1, 1, 10) respectively; and the number of points in the four data sets is all set as 2000.

(a) DS1

(b) DS2

(c) DS3

(d) DS4

Sfig. 5. The number of active cores with time evolution for several different values of parameter  $\delta$  in SSynC algorithm. In Sfig.5, parameter  $\delta$  is set as six different values (16, 20, 24, 28, 32, 36) respectively, parameter  $\varepsilon$  is set as 1, and the number of points in the four data sets is all set as 2000.

#### 4.2.4 Compare the clustering results among SynC algorithm, ESynC algorithm, SSynC algorithm and some classical clustering algorithms

Stable 4. Comparison of three different synchronization algorithms (SynC, ESynC and SSynC) by using four artificial data sets (DS1 – DS4). In Stable 4, parameter  $\delta = 18$ , the number of data points  $n = 10000$ , parameter  $\varepsilon$  (a very small real number, if the distance of two points is less than  $\varepsilon$ , then they are regarded as in the same cluster) = 0.00001 in SSynC algorithm.

| Comparison of Algorithms       |              | DS1       | DS2       | DS3       | DS4       |
|--------------------------------|--------------|-----------|-----------|-----------|-----------|
| Spend time (second)            | SynC         | 448       | 553       | 538       | 525       |
|                                | ESynC        | 56        | 70        | 107       | 81        |
|                                | SSynC        | <b>52</b> | <b>69</b> | <b>34</b> | <b>52</b> |
| Iterative times                | SynC         | 41        | 50        | 50        | 50        |
|                                | ESynC, SSynC | <b>4</b>  | <b>5</b>  | <b>8</b>  | <b>6</b>  |
| The number of steady locations | SynC         | 254       | 379       | 260       | 431       |
|                                | ESynC, SSynC | <b>14</b> | <b>5</b>  | <b>25</b> | <b>8</b>  |

**Note:** The bold in Stable 4 marks the better results of SSynC algorithm or ESynC algorithm.

Stable 5. Compare the clustering quality of several clustering algorithms (SynC, ESynC, SSynC, and some classical clustering algorithms) using six kinds of artificial data sets (DS2, DS4, DS5, DS6, DS7, and DS8). In Stable 5, parameter  $\delta = 18$  in DS2, DS4, DS5, and DS6; parameter  $\delta = 30$  in DS7 and DS8; parameter  $\varepsilon = 0.00001$  in SSynC algorithm.

| $\varepsilon = 10$      | $\delta \in [14, 22]$ | $\delta \in [16, 161]$ | $\delta \in [17, 215]$ | $\delta \in [22, 298]$ |

(b) DS9 – DS12

| SSynC                   | DS9                   | DS10                   | DS11                   | DS12                   |
|-------------------------|-----------------------|------------------------|------------------------|------------------------|
| $\varepsilon = 0.00001$ | $\delta \in [9, 83]$  | $\delta \in [10, 208]$ | $\delta \in [13, 248]$ | $\delta \in [19, 297]$ |
| $\varepsilon = 0.0001$  | $\delta \in [9, 83]$  | $\delta \in [10, 208]$ | $\delta \in [13, 248]$ | $\delta \in [19, 297]$ |
| $\varepsilon = 0.001$   | $\delta \in [9, 83]$  | $\delta \in [10, 208]$ | $\delta \in [13, 248]$ | $\delta \in [19, 297]$ |
| $\varepsilon = 0.01$    | $\delta \in [9, 83]$  | $\delta \in [10, 208]$ | $\delta \in [13, 248]$ | $\delta \in [19, 297]$ |
| $\varepsilon = 0.1$     | $\delta \in [9, 83]$  | $\delta \in [10, 208]$ | $\delta \in [13, 248]$ | $\delta \in [19, 297]$ |
| $\varepsilon = 1$       | $\delta \in [9, 83]$  | $\delta \in [10, 208]$ | $\delta \in [13, 248]$ | $\delta \in [19, 297]$ |
| $\varepsilon = 10$      | $\delta \in [14, 83]$ | $\delta \in [16, 208]$ | $\delta \in [16, 249]$ | $\delta \in [19, 297]$ |

(c) DS13 – DS16

| SSynC                | DS13                   | DS14                    | DS15                    | DS16                     |
|----------------------|------------------------|-------------------------|-------------------------|--------------------------|
| $\varepsilon = 0.01$ | $\delta \in [40, 854]$ | $\delta \in [63, 1271]$ | $\delta \in [87, 1850]$ | $\delta \in [123, 2917]$ |
| $\varepsilon = 0.1$  | $\delta \in [40, 854]$ | $\delta \in [63, 1271]$ | $\delta \in [87, 1850]$ | $\delta \in [123, 2917]$ |
| $\varepsilon = 1$    | $\delta \in [40, 854]$ | $\delta \in [63, 1271]$ | $\delta \in [87, 1851]$ | $\delta \in [123, 2917]$ |
| $\varepsilon = 10$   | $\delta \in [40, 854]$ | $\delta \in [63, 1271]$ | $\delta \in [87, 1851]$ | $\delta \in [123, 2917]$ |
| $\varepsilon = 20$   | $\delta \in [40, 854]$ | $\delta \in [63, 1271]$ | $\delta \in [87, 1851]$ | $\delta \in [123, 2918]$ |
| $\varepsilon = 30$   | $\delta \in [41, 854]$ | $\delta \in [64, 1271]$ | $\delta \in [87, 1851]$ | $\delta \in [125, 2919]$ |
| $\varepsilon = 40$   | $\delta \in [42, 854]$ | $\delta \in [65, 1271]$ | $\delta \in [89, 1851]$ | $\delta \in [125, 2917]$ |

**Note:** SSynC algorithm gets 12 clusters when parameter  $\delta$  in its valid interval. In the DS5 ( $n = 10000$ ) data set, there are two clusters that are almost connected to one cluster, so parameter  $\varepsilon$  affects the final number of clusters very much. For other data sets, parameter  $\varepsilon$  affects the final number of clusters little.

### 4.3 Experimental results of several UCI data sets

Stable 8. Compare three synchronization algorithms (SynC, ESynC and SSynC) by using several UCI data sets. In Stable 8, parameter  $\varepsilon = 1$  in SSynC algorithm.

(a) The setting of parameter  $\delta$  in three synchronization algorithms for several UCI data sets

| UCI Data Sets      | parameter $\delta$ in<br>SynC, ESynC and SSynC |
|--------------------|--|
| Iris               | 120  |
| Wine               | 305  |
| Wdbc               | 345  |

**Note1:** In the Letter-recognition data set, DBSCAN algorithm obtains 21 clusters and 243 isolates when parameter  $\delta = 160.0001$ , so we set parameter  $\delta = 160$  in DBSCAN. The sign ‘-’ in AP column means that the time cost is too larger.

**Note2:** In Stable 9, the largest values of NMI and AMI in every data set are shown in bold.

#### 4.4 Experimental results of three bmp pictures

Stable 10. Compare three different synchronization algorithms (SynC, ESynC and SSynC) by using three picture data sets. In Stable 10, parameter  $\delta = 18$  or 30 in SynC, ESynC and SSynC; parameter  $\varepsilon = 1$  in SSynC algorithm.

(a) parameter  $\delta = 18$

**Note:** The bold in Stable 10 marks the better results of SSynC algorithm or ESynC algorithm.

Origina Picture

SSynC, ESynC (final k = 14)

SynC (final k = 2868)

Kmeans, FCM (final  $k = 1$ )

DBSCAN (final  $k = 112$ )

Mean Shift (final  $k = 10$ )

(a)  $\delta = 18$  for SynC, ESynC, SSynC, DBSCAN, and Mean Shift; predefined  $k$  (number of clusters) = 14 for KMeans and FCM.

Origina Picture

SSynC, ESynC (final  $k = 6$ )

SynC (final  $k = 2896$ )

Kmeans, FCM (final  $k = 1$ )

DBSCAN (final  $k = 35$ )

Mean Shift (final  $k = 4$ )

(b)  $\delta = 30$  for SynC, ESynC, SSynC, DBSCAN, and Mean Shift; predefined  $k$  (number of clusters) = 6 for KMeans and FCM.

Sfig. 11. Compare the original picture and several compressed pictures of Picture3 by clustering pixel points of Picture3 in RGB color space using several algorithms. In Sfig. 11, several compressed pictures are drawn using the means of clusters obtained by clustering  $200 * 200$  pixel points of Picture3 in RGB space.
